AI-ASSISTED LEGAL WORKFLOWS — PORTFOLIO SUMMARY

Kolkata, India | shrutiagarwal.new@gmail.com | LinkedIn

A set of AI-assisted legal workflows built alongside my contracts, compliance, and litigation practice, designed to speed up first-pass review without displacing legal judgment. Each was tested against real public source material or clearly-labeled synthetic examples — see the note on methodology below.

1. CONTRACT RISK REVIEW & NEGOTIATION PLAYBOOK GENERATOR

Designed a structured, precedent-grounded AI workflow to flag contract clauses that deviate from market-standard positions

- Checklist covers indemnity, liability caps, termination, assignment, governing law, and buy-back pricing — the categories where founder/commercial disputes actually arise.
- v2 grounds every flag against a curated reference-clause library (retrieval-style prompting) rather than the model's general knowledge, producing citation-style redlines.
- Validated against the actual, current Y Combinator Post-Money SAFE template: correctly returned a “clean, no material issues” result — confirming the tool distinguishes well-drafted instruments rather than manufacturing findings.
- Extended into a negotiation playbook format (opening ask, fallback positions, walk-away triggers) — the tool surfaces fallback options from precedent; counsel decides which to deploy.

2. AML/KYC CLIENT RISK REVIEW ASSISTANT

Built a workflow to map UBO ownership chains and flag FATF-aligned red flags for first-pass CDD/EDD screening

- Flags layered/offshore structures, undisclosed ownership tiers, PEP exposure, and nominee arrangements, with a recommended escalation step.
- Tested only on synthetic ownership structures by design — real onboarding files require firm-approved data handling, not a general-purpose AI tool.

3. ESG READINESS & GOVERNANCE GAP ANALYZER

Formalized an end-to-end ESG advisory engagement into a repeatable AI-assisted gap-analysis method

- Benchmarks a company's disclosures against a 7-point checklist: governance, climate/environmental, social, materiality assessment, targets/KPIs, third-party assurance, and framework alignment (GRI/TCFD/SASB).
- Extends real ESG advisory work delivered at Corporate Advisory Group (Dubai, ADGM) into a reusable methodology.
- Validated against Abu Dhabi Islamic Bank's real public ESG overview page: correctly flagged that a landing page cannot be assessed as a complete disclosure, rather than overstating gaps from limited material.

4. JUDGMENT SUMMARIZER & ARGUMENT NOTE BUILDER

Standardized judgment summaries for hearings and client conferences using a structured AI prompting method

- Explicitly separates ratio decidendi from obiter dicta — the detail most likely to be tested by a litigation interviewer.
- Validated against a real, current Calcutta High Court judgment (M/S. Jindal (India) Ltd vs. State of West Bengal, July 2025) — fully verifiable against the public record on Indian Kanoon.
- Extended into an argument-note builder that organizes multiple briefs and anticipates counter-arguments for a hearing — it structures precedent, counsel decides strategy.

PHASE 2 ROADMAP (SCOPED, NOT YET BUILT)

Board Resolution & Governance Document Generator; Shareholders' Agreement Clause Comparator; Sanctions & Adverse Media Triage Dashboard; Writ Petition Research & Case Strategy Assistant. The latter two are deliberately deferred pending explicit guardrails around unlicensed-data risk and the line between research support and legal-judgment displacement — documented in full on request.

METHODOLOGY NOTE

These are prompting workflows built on general-purpose LLMs (Claude/ChatGPT), not fine-tuned models. Three of the four are validated against real public documents (a live court judgment, the current YC SAFE template, and a real bank's public ESG page); the AML/KYC example uses clearly-labeled synthetic data by design, since real onboarding files require firm-approved data handling, not a general-purpose AI tool. Full prompts, sample inputs, and outputs are available on request.
